Dear Hiring Manager,

Hope you are doing great!

Reliant Health Partners is building Azure-hosted portals, CRM functionality, and intelligent automation that must connect user needs with dependable UI, API, and data-layer solutions. The Software Engineer - Full-Stack role calls for someone who can own features from requirements through deployment while helping modernize healthcare transaction workflows.

I bring **8+ years** in software engineering roles, including my current work as a **Software Engineer** at Microsoft. My background aligns with full-stack development using **C#**, ASP.NET patterns, APIs, SQL Server, Git, CI/CD, and Azure-oriented application delivery, along with hands-on **AI chatbot integration** work.

I have worked across four technology organizations and developed the adaptability needed to move between technical environments and problem spaces. My work includes building application features across UI, API, and data concerns, collaborating with stakeholders, and troubleshooting issues through structured problem-solving. I have also integrated an AI chatbot to support a more responsive application experience and intelligent automation goals. That combination of software engineering fundamentals, curiosity, and practical delivery would support Reliant's portals, CRM systems, and automation initiatives.

I would love to discuss how my background in full-stack development, Azure-oriented delivery, and AI automation can contribute to **Reliant Health Partners'** goals.

Looking forward to hearing from you soon,

Best regards,

Michael Cee
